

Due to the low height of the HFX mini case, you have to use riser cards. If you want to install a VGA card with PCIe16x, then you have to choose the right motherboard. Most micro-ATX motherboards have the slot for the VGA in the right position. But some ATX motherboards have the PCIe16x slot in another position.

**Your motherboard must have the PCIe16x slot in the 1st or 2nd row! Otherwise you can only use the onboard VGA.**

If the VGA is in the 1st row, you can use the PCIe16x riser with the included extender.

If the VGA is in the 2nd row, you can use the PCIe16x riser without the included extender.

If the VGA is in the 3rd row, you can not use the PCIe16x riser. In this case you can only use the onboard VGA.
